Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Organically Modified Silica competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Organically Modified Silica (ORMOSIL) refers to a class of hybrid materials derived from silica (SiO_2) that incorporates organic functional groups into its molecular structure. ORMOSILs are synthesized typically through sol-gel processing of organoalkoxysilanes, where organic side chains are chemically bonded to a silica backbone. This combination allows ORMOSILs to exhibit properties of both inorganic silica—such as thermal stability, mechanical strength, and chemical resistance—and organic polymers—such as flexibility, hydrophobicity, and reactivity to functionalization. ORMOSILs are widely used in coatings, adhesives, optical devices, and biomedical applications due to their tunable surface properties and compatibility with a broad range of organic and inorganic materials. Organically Modified Silica (ORMOSIL) materials are characterized by key parameters including their hybrid chemical composition of an inorganic silica (SiO_2) backbone covalently bonded with organic functional groups such as methyl, phenyl, or epoxy. They are typically synthesized via a sol-gel process using organoalkoxysilanes like MTMS or GPTMS, resulting in materials with tunable porosity (non-porous to mesoporous), densities around $1.1\text{--}1.5\text{ g/cm}^3$, and refractive indices between 1.40 and 1.55. ORMOSILs exhibit good thermal stability (up to $\sim 500^\circ\text{C}$), enhanced mechanical properties such as flexibility and toughness, and customizable surface characteristics ranging from hydrophobic to hydrophilic. They form transparent coatings or films via techniques like spin-coating and are suitable for optical, protective, and biomedical applications due to their chemical versatility, film-forming ability, and biocompatibility.

The global Organically Modified Silica market size was estimated at USD 2649.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
