Abstracts

Orthopaedic bone cement, also known as polymethylmethacrylate (PMMA) bone cement, is a medical-grade polymer used primarily in joint replacement surgeries, such as hip and knee arthroplasty, to securely anchor prosthetic implants to the patient's natural bone structure. It functions as a space-filling grout rather than an adhesive, mechanically interlocking with the bone's porous surface while providing immediate stability and load-bearing capacity for the implant. The material is prepared intraoperatively by mixing a liquid monomer with a powdered polymer, initiating an exothermic polymerization reaction that hardens within minutes to form a durable, biocompatible interface. In addition to its mechanical role, modern formulations often include antibiotics to reduce the risk of postoperative infections, particularly in revision surgeries or patients with compromised immune systems. While not biodegradable, it remains the gold standard in cemented arthroplasty due to its proven long-term performance, ease of use, and cost-effectiveness compared to alternative fixation methods like press-fit or biological ingrowth systems.

The global Orthopaedic Bone Cement market size was estimated at USD 1218.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.45% during the forecast period.
