## Abstracts

Orthopedic oscillating saws are specialized surgical instruments used primarily in orthopedic procedures for precise bone cutting and shaping through a rapid back-and-forth oscillating motion rather than a continuous rotation. These devices are designed to minimize soft tissue damage, reduce the risk of thermal necrosis, and provide surgeons with enhanced control and accuracy during complex operations such as joint replacements, osteotomies, or fracture repairs. They typically consist of a power unit (pneumatic or electric), a handpiece, and interchangeable blades optimized for various bone densities and surgical requirements. Key differentiating features include variable speed settings, ergonomic design to reduce surgeon fatigue, compatibility with sterilization protocols, and integration with advanced surgical navigation systems for improved outcomes. The market for these devices is driven by the rising prevalence of musculoskeletal disorders, an aging global population, increasing demand for minimally invasive surgeries, and ongoing technological advancements aimed at improving precision, safety, and efficiency in the operating room.

The global Orthopedic Oscillating Saw market size was estimated at USD 650.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
