Abstracts

Orthostatic hypotension (OH) is a medical condition characterized by a significant drop in blood pressure upon standing, typically defined as a decrease of at least 20 mmHg in systolic pressure or 10 mmHg in diastolic pressure within three minutes of standing. This condition results from an impaired autonomic nervous system response, leading to symptoms such as dizziness, lightheadedness, blurred vision, and fainting, which can severely impact daily functioning and quality of life. OH can be a primary disorder or secondary to other conditions, such as Parkinson's disease, diabetes, or as a side effect of medications like antihypertensives or antidepressants. It is particularly prevalent among older adults, though it can affect individuals of any age, and its management often involves a combination of pharmacological treatments, lifestyle modifications, and patient education to mitigate risks and improve outcomes.
