Abstracts

An out runner brushless motor is a type of electric motor where the outer casing (the "bell") rotates around a fixed central stator, as opposed to an in runner design where the inner rotor spins inside a stationary housing. This configuration offers high torque at relatively low RPMs, making it particularly suitable for applications requiring direct drive without the need for additional gearing, such as in drones, RC aircraft, propellers, and certain industrial automation systems. The design also benefits from efficient heat dissipation due to the outer rotor acting as a heat sink, contributing to improved durability and performance under continuous load conditions.

The global Out Runner Brushless Motor market size was estimated at USD 1180.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
