## Abstracts

Outdoor pool heat pumps are energy-efficient devices designed to extend the swimming season by extracting ambient heat from the surrounding air and transferring it to pool water, utilizing a refrigeration cycle that includes a compressor, evaporator, condenser, and expansion valve to maintain desired water temperatures regardless of external climate fluctuations. These systems are favored for their low operating costs compared to gas or electric resistance heaters, with many models offering coefficient of performance (COP) ratings between 5 and 6, meaning they produce 5-6 units of heat for every unit of electricity consumed, making them a sustainable and cost-effective solution for residential, commercial, and public swimming pools in regions with moderate to warm climates.

The global Outdoor Pool Heat Pumps market size was estimated at USD 1285.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
