## Abstracts

Ovarian cancer microtubule inhibitors are a class of anti-tumor drugs used to treat ovarian cancer. They inhibit cell division and proliferation by interfering with the normal function of microtubules within cancer cells. These drugs mainly prevent the polymerization or depolymerization of microtubules by binding to tubulin, thereby interfering with the cell's mitosis process, causing cancer cells to be unable to divide normally, and eventually triggering cell death.

The global Ovarian Cancer Microtubule Inhibitors market size was estimated at USD 1676.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
