Abstracts

Over Voltage Protection ICs (OVP ICs) are integrated circuits designed to safeguard electronic devices and systems from voltage surges and transients that exceed predetermined safe operating levels, functioning by continuously monitoring the input voltage and rapidly disconnecting the power supply through an internal or external switch?such as a MOSFET?when an overvoltage condition is detected, thereby preventing damage to sensitive downstream components like processors, batteries, and communication interfaces; these ICs are characterized by features including precise voltage threshold settings, low quiescent current for power efficiency, fast response times (often in nanoseconds), and robustness against electrical stress, and they find critical applications across consumer electronics, automotive systems, industrial equipment, and telecommunications infrastructure where reliability and protection against power anomalies are paramount.

The global Over Voltage Protection Ic market size was estimated at USD 1235.9 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
