## Abstracts

An overclocked ultrasonic generator is a device that converts mains electricity (usually 220V or 380V, 50Hz or 60Hz) into a high-frequency AC signal that matches the ultrasonic transducer. This high-frequency AC signal is used to drive the ultrasonic transducer to work, thereby generating ultrasonic vibrations. The working principle of the overclocked ultrasonic generator involves signal generation and amplification. First, a signal generator generates a signal of a specific frequency, which can be a sinusoidal signal or a pulse signal, and the frequency of the signal matches the resonant frequency of the ultrasonic transducer. Then, the signal is amplified by a power amplifier to generate a sufficiently strong drive signal to drive the ultrasonic transducer. After the transducer receives the high-frequency AC signal, it converts it into high-frequency mechanical vibrations to generate ultrasonic waves.

The global Overfrequency Ultrasonic Generator market size was estimated at USD 79.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
