Abstracts

An overheight vehicle detection system (OVDS) is a system that is used to detect vehicles that are too tall to safely pass under an overhead structure, such as a bridge or tunnel. OVDS systems typically use a combination of sensors, such as radar, lasers, and cameras, to detect the height of approaching vehicles. If a vehicle is detected to be too tall, the OVDS system will typically activate a warning signal, such as a flashing light or a siren, to alert the driver. In some cases, the OVDS system may also be able to stop the vehicle from passing under the overhead structure.

The global Overheight Vehicle Detection System market size was estimated at USD 185.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
