Abstracts

According to the different types of inspection, semiconductor quality control equipment can be divided into inspection equipment and metrology equipment. Semiconductor inspection runs through the entire semiconductor process, that is, the front-end and back-end. Semiconductor inspection includes optical inspection, electron beam inspection and X-ray measurement. It mainly detects whether there are abnormal quality conditions on the surface of the wafer or in the circuit structure, such as scratches/scratches, particle contamination, graphic errors and other defects. Different inspection technologies have obvious differences, mainly reflected in accuracy, speed and inspection purposes. Semiconductor Metrology refers not only to the measurement behavior itself, but also to the measurement made by considering errors and accuracy, as well as the performance and mechanism of the measuring equipment. If the measurement result is not within the given specification range, the manufacturing equipment cannot continue to operate as designed. According to different application scenarios, semiconductor inspection can be mainly divided into Optical Critical Dimension OCD, Film Metrology, Overlay Metrology, Mask/Reticle Inspection, Non-patterned Wafer Inspection, Patterned Wafer Inspection and Review SEM. Overlay error refers to the deviation of the plane distance between the centers of two-layer graphic structures. As the number of integrated circuit layers continues to increase, multiple patterning and multiple exposure lithography processes are becoming increasingly common, which makes the overlay accuracy between the circuit patterns formed in each step critical. Excessive overlay error can cause the circuit pattern to be misaligned, which in turn causes the entire circuit to fail and be scrapped. Therefore, the measurement of overlay error is usually indispensable after each lithography step. In order to ensure the precise alignment and placement of circuit patterns at different levels and the same level, Overlay Metrology System is widely used. Overlay measurement system terminals are mainly used in wafer fabs and packaging plants.

They are divided into front-end and back-end packaging and testing. Currently, overlay measurement systems are mainly used in front-end wafer manufacturing, of which 12-inch wafers account for more than 70%. Globally, overlay measurement system companies are mainly concentrated in the United States, Europe, Israel, Japan, China, South Korea and other regions/countries. The core companies are mainly KLA, AMAT, Onto, AUROS, Hitachi, etc., and the top 3 companies have a share of more than 48%.

The global Overlay Measurement System market size was estimated at USD 637.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
