Report Overview

Oxide CMP (Chemical Mechanical Planarization) slurry is a specialized chemical solution used in semiconductor manufacturing to achieve ultra-flat surfaces on silicon wafers during the fabrication process. It consists of abrasive particles, such as silica or ceria, suspended in a liquid medium along with chemical additives that enhance material removal rates while maintaining selectivity and uniformity. The slurry plays a critical role in the planarization of oxide layers (e.g., silicon dioxide) to ensure precise layering and defect-free surfaces, which are essential for advanced semiconductor devices. Its formulation is tailored to balance mechanical abrasion and chemical etching, making it a key enabler for high-performance chip production in nodes below 10nm. The market for Oxide CMP slurry is driven by the growing demand for smaller, faster, and more energy-efficient semiconductors, particularly in applications like logic chips, memory devices, and advanced packaging technologies.
