Abstracts

Oxo biodegradable bags are specialized plastic bags designed to degrade more rapidly than conventional plastics through a process that involves the incorporation of additives (often metal salts) which accelerate oxidation when exposed to environmental factors such as heat, UV light, or mechanical stress, leading to fragmentation into smaller pieces that are then susceptible to further biodegradation by microorganisms. These bags are positioned as an intermediate solution between traditional plastics, which persist for centuries, and fully compostable bioplastics, offering potential benefits in reducing plastic pollution, particularly in contexts where waste management infrastructure is inadequate or where littering is prevalent. The market for oxo biodegradable bags is driven by increasing regulatory pressures on single-use plastics, growing public awareness of environmental issues, and demand from sectors such as retail, agriculture, and waste management seeking more sustainable alternatives; however, it also faces significant challenges, including scientific debate over the completeness and environmental safety of degradation, potential microplastic pollution concerns, and competition from other biodegradable or compostable materials which may be perceived as more environmentally sound. Geographically, demand is uneven, with stronger uptake in regions with less developed waste systems or where policy incentives exist, while in more regulated markets, skepticism from environmental agencies and shifting legislation toward circular economy principles may limit growth.

The global Oxo Biodegradable Bags market size was estimated at USD 1400.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
