Abstracts

The oxygen index analyzer is a specialized laboratory instrument designed to measure the minimum concentration of oxygen in an oxygen-nitrogen mixture required to support the combustion of a material, a parameter known as the Limiting Oxygen Index (LOI). It operates by placing a vertically oriented test specimen in a controlled atmosphere glass column, where it is exposed to a precisely regulated flow of oxygen and nitrogen; an ignition source is applied to the top of the sample, and the oxygen concentration is systematically adjusted to determine the threshold at which sustained burning occurs. This quantitative method provides a critical, standardized metric (ASTM D2863, ISO 4589-2) for evaluating and comparing the flammability characteristics and fire resistance of various polymers, textiles, composites, and other solid materials, making it an essential tool in material science, quality control, and regulatory compliance for industries prioritizing fire safety.

The global Oxygen Index Analyzers market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
