Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on p-Hydroxystyrene competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global p-Hydroxystyrene production reached approximately 421 tons, with an average global market price of around US\$ 118 per kg. p-Hydroxystyrene has the chemical formula C_8H_8O . It is a phenolic compound in which a hydroxyl group ($-OH$) is attached to the para position of a styrene molecule. This compound appears as a colorless liquid with a vanilla-like odor. It is a reactive monomer that can undergo polymerization to yield polymers such as poly(4-hydroxystyrene). As a functional styrene monomer, p-Hydroxystyrene exhibits broad market potential. It is a key raw material for the production of high-performance photoresists, functional polymers, and resin materials. With advances in electronic display technologies and increasing demand for microfabrication, its use in photoresist formulations continues to expand. Notably, in KrF and ArF photoresists, p-Hydroxystyrene shows strong copolymerization capability, enabling modulation of polymer polarity and solubility characteristics, thereby optimizing lithographic performance. In coatings, adhesives, and electronic encapsulation, p-Hydroxystyrene-derived polymers demonstrate impressive adhesion, thermal stability, and dielectric properties, supporting the demands of the automotive, electronics, and high-end equipment industries for lightweight and highly reliable materials. Concurrently, sustainability trends have spurred the development of bio-based p-Hydroxystyrene.

The global p-Hydroxystyrene market size was estimated at USD 49.68 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
