Abstracts

The packaging burst strength test is a standardized test method to evaluate the ability of packaging materials (such as cardboard, corrugated paper, plastic film, etc.) to resist rupture under uniform pressure. The test applies increasing pressure to the surface of the material through a hydraulic or pneumatic device until the sample ruptures, and records the maximum burst value (unit: kPa or psi). This indicator directly reflects the impact resistance and load-bearing performance of the package during transportation and stacking, and is widely used in quality control in logistics, food, medicine and other industries to ensure the safety of products during storage and transportation.

The global Packaging Burst Strength Test market size was estimated at USD 360.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
