Report Overview

Synthetic oil is a lubricant consisting of chemical compounds that are artificially made. Synthetic lubricants can be manufactured using chemically modified petroleum components rather than whole crude oil, but can also be synthesized from other raw materials. One of the most versatile types of synthetics is polyalkylene glycol (PAG) lubricants. PAGs are generally known as compressor lubricants, and their use in industry has increased since the 1980s. Increasing performance standards in the automotive and industrial markets peg these sectors as areas that show promise for growth.

Synthetic lubricants provide numerous benefits when used for automotive applications such as excellent thermal stability and low friction. Rising awareness regarding the advantages of the product, as opposed to its mineral counterparts, will augment industry growth over the forecast period. A major application of synthetic lubricants is their use as heat transfer fluids in heavy machinery and heat exchangers.
