Report Overview

Palladium is one of the rarest precious metals in the world. The element symbol Pd is one of the platinum group elements. Palladium is extremely pure, similar in appearance to platinum, and has a silver-white metallic luster in its natural state that never fades. Palladium is heat-resistant, corrosion-resistant, wear-resistant and ductile. It is interchangeable with platinum in terms of purity, rarity and durability, making it an ideal material for jewelry and gem-setting. The palladium and platinum markets are interconnected in terms of supply and demand. In most platinum and palladium mines, they occur as co-products or by-products. As a direct result of the presence of associated metals, palladium is usually a co-product or by-product, and its supply often depends on the supply, demand and price of the primary metal. Less than 10% of global palladium production is driven by palladium prices.

The global Palladium Ingots market size was estimated at USD 16860 million in 2023 and is projected to reach USD 22385.91 million by 2032, exhibiting a CAGR of 3.20% during the forecast period.
