### Report Overview

Pancreatic cancer arises when cells in the pancreas, a glandular organ behind the stomach, begin to multiply out of control and form a mass. These cancerous cells have the ability to invade other parts of the body. A number of types of pancreatic cancer are known. The most common, pancreatic adenocarcinoma, accounts for about 90% of cases, and the term 'pancreatic cancer' is sometimes used to refer only to that type. These adenocarcinomas start within the part of the pancreas that makes digestive enzymes. Several other types of cancer, which collectively represent the majority of the no adenocarcinomas, can also arise from these cells. About 1-2% of cases of pancreatic cancer are neuroendocrine tumors, which arise from the hormone-producing cells of the pancreas. These are generally less aggressive than pancreatic adenocarcinoma.

The global Pancreatic Cancer Diagnostic Devices market size was estimated at USD 5714 million in 2023 and is projected to reach USD 7073.59 million by 2032, exhibiting a CAGR of 2.40% during the forecast period.
