Abstracts

A panoramic radiograph machine, also known as an orthopantomogram (OPG) machine, is a specialized medical imaging device used primarily in dentistry to capture a single, wide-view image of the entire oral and maxillofacial region—including the teeth, jaws, sinuses, and temporomandibular joints—in a two-dimensional format. It operates by rotating an X-ray source and detector around the patient's head, producing a curved-plane tomographic image that provides a comprehensive overview with minimal radiation exposure compared to full-mouth intraoral series. This equipment is essential for diagnostic purposes such as detecting impacted teeth, evaluating jaw abnormalities, planning orthodontic treatments, and assessing bone structure prior to implant placement or oral surgery.

The global Panoramic Radiograph Machine market size was estimated at USD 265.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
