Abstracts

Paper Mill Dryer Section is a crucial part of the paper manufacturing process where the moisture in the wet paper sheet is removed to produce dry paper. After the paper pulp is formed and pressed to remove excess water, it passes through a series of heated dryer cylinders. These dryers are typically large, rotating drums heated by steam, which transfer heat to the paper as it moves through the section. As the paper moves over these cylinders, the heat evaporates the remaining moisture, drying the paper to the desired consistency. The dryer section plays a key role in controlling the final paper quality, thickness, and smoothness by maintaining precise temperature and humidity levels throughout the drying process.

The global Paper Mill Dryer Section market size was estimated at USD 907.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
