Report Overview

Among the common factors that affect paper strength, one mechanism believes that the bonding force between fibers is an important factor affecting paper strength, and another mechanism believes that dry strength agent is a highly efficient dispersant that can make the fiber arrangement more regular, the bonding more stable and tight, and enhance the bonding force between fibers, so that the paper has a higher dry strength. Under normal circumstances, when no additives are added, the strength of the paper after being wetted is only 5%-10% of the strength when dry. After adding wet strength agent, most of the paper can maintain 20%-40% of the original dry strength. Papermaking strength agent not only increases the bonding area between fibers, increases the number of bonding points of hydrogen bonds between fibers, but also increases the firmness of the bonding points, thereby effectively improving the dry strength of paper, breaking length, bursting resistance, tensile strength, ring crush strength, peel strength and other physical indicators.
