Report Overview

A parabolic solar concentrator is a curved array of mirrors that reflects all incident light onto a single point. This significantly magnifies the power of the sun, generating intense amounts of heat. There are many possible uses for solar concentrators. Small concentrators generate heat for cooking and domestic hot water. Large concentrators generate steam for power generation and industrial processes. Solar concentrators are often used in conjunction with a Fresnel lens. This is a type of lens that is specially curved to focus all the light that passes through it into a single point.
