Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Parallel Hollow Compound Staple Fiber competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Parallel hollow compound staple fiber is a type of engineered fiber characterized by a parallel bicomponent structure—typically involving two different polymers running side by side—and a hollow core that runs longitudinally through the fiber. After spinning, the filament is cut into short lengths (staple fibers) for use in various nonwoven or textile applications. This design combines the benefits of compound fiber bonding and hollow fiber functionality. The parallel bicomponent arrangement allows one polymer to serve as a low-melting bonding agent (like polyethylene), while the other provides strength and resilience (like polyester or polypropylene). Meanwhile, the hollow structure reduces weight, enhances insulation, improves bulkiness, and adds softness or resilience. These fibers are commonly used in filling materials (pillows, bedding), filtration media, thermal insulation, and sound-absorbing applications.

The global Parallel Hollow Compound Staple Fiber market size was estimated at USD 647.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
