Abstracts

Parallel robots are a sub-segment of industrial robots, referring to robots whose arms contain rods that form a closed-loop structure. Parallel robots are mainly composed of a dynamic platform, a static platform, and at least two independent motion branches. They have two or more degrees of freedom and have the advantages of fast movement speed, high rigidity, and high precision. They are mainly used for high-speed sorting and packaging in integrated mechanical equipment and production lines. The driving factors of the parallel robot market mainly include the following: Increased demand for industrial automation and intelligent manufacturing. With the transformation and upgrading of the global manufacturing industry, industrial automation and intelligent manufacturing have become mainstream trends. Parallel robots, with their advantages of high precision, high speed, large load and strong flexibility, play an increasingly important role in industrial automation and intelligent manufacturing. Especially in the automotive, electronics, food, medicine and other industries, parallel robots have become an important tool for improving production efficiency, reducing production costs and ensuring product quality. The disappearance of the demographic dividend and the rise in labor costs. In many countries and regions, the demographic dividend is gradually disappearing and labor costs are rising. This has put manufacturing companies under greater cost pressure and urgently needs to improve production efficiency through automation and intelligent means. As an efficient automated production equipment, parallel robots can significantly reduce labor costs and improve production efficiency, so they have received widespread attention and application from manufacturing companies. Technological progress and industrial upgrading. With the continuous advancement of robot technology and industrial upgrading, the performance of parallel robots has been significantly improved. For example, by adopting advanced sensors, controllers, actuators and other technologies, parallel robots can achieve more accurate, efficient and stable motion control. At the same time, with the continuous

expansion and deepening of the application scenarios of parallel robots, its market demand has also been further released. Policy support and industrial planning Governments of various countries have introduced policies to support the development of the robot industry and promote the automation and intelligent upgrading of the manufacturing industry. For example, the Chinese government has formulated industrial plans such as "Made in China 2025", which clearly proposes to vigorously develop the robot industry and promote the transformation and upgrading of the manufacturing industry. These policies provide strong guarantees and support for the development of the parallel robot market. Market demand and competitive landscape The market demand for parallel robots continues to grow, especially in light industries such as 3C electronics, food packaging, medicine, and daily chemicals. The demand for parallel robots in these fields mainly stems from their product characteristics, such as large number of products, small size, and strong production capacity. At the same time, with the intensification of market competition, parallel robot companies need to continuously innovate and improve product quality to meet market demand and maintain competitive advantages. Attention and support from investment institutions In recent years, more and more investment institutions have begun to pay attention to the parallel robot market and actively participate in the financing and mergers and acquisitions of related companies. The attention and support of these investment institutions have provided more funds and resources for the development of the parallel robot market, and promoted the rapid growth and expansion of related companies. In summary, the driving factors of the parallel robot market mainly include the increase in demand for industrial automation and intelligent manufacturing, the disappearance of the demographic dividend and the increase in labor costs, technological progress and industrial upgrading, policy support and industrial planning, market demand and competition pattern, and the attention and support of investment institutions. These factors have jointly promoted the rapid development and sustained growth of the parallel robot market.

The global Parallel Robotic Gripper market size was estimated at USD 4591.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
