Abstracts

Parallel slide gate valves are specialized industrial flow control devices designed for high-pressure and high-temperature applications, primarily in power generation, oil and gas, petrochemical, and water treatment industries. Unlike traditional wedge gate valves, these valves feature two parallel discs that slide against stationary seats, ensuring a tight seal even under extreme thermal or pressure fluctuations, which minimizes leakage and reduces seat wear. They are particularly valued for their ability to handle abrasive and corrosive media, bidirectional flow, and provide reliable shut-off in systems where pressure differentials are significant. The design often includes a self-adjusting mechanism to compensate for thermal expansion and seat wear, enhancing longevity and operational safety in critical processes.

The global Parallel Slide Gate Valves market size was estimated at USD 1250.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
