## Abstracts

Parallelogram manipulator is a special type of robot arm structure, which uses the characteristics of parallelogram linkage mechanism to realize specific motion mode and function. Such manipulators typically include a plurality of links connected by rotational joints to form one or more parallelogram geometries. Due to the nature of the parallelogram, i.e. the opposite sides always remain parallel, this enables the robot end-effector (such as a gripper or tool) to perform translational motion while maintaining the same orientation.

The global Parallelogram Manipulator market size was estimated at USD 85.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.00% during the forecast period.
