Abstracts

Paraquat aqueous solution is a non-selective, fast-acting contact herbicide widely used in agricultural and non-agricultural settings for broad-spectrum weed control. It functions by disrupting photosynthesis through the production of reactive oxygen species upon contact with plant tissues, leading to rapid desiccation and death of green plant parts. The solution is typically formulated as a concentrated liquid diluted with water before application, and its effectiveness against a wide range of annual weeds, along with its rainfast properties (quick absorption minimizing wash-off), makes it a staple in no-till farming systems, orchard management, and as a desiccant prior to harvest. However, due to its high acute toxicity to humans and mammals?with no known antidote?it is classified as a restricted-use pesticide in many countries, requiring specialized handling, protective equipment, and often application by licensed professionals to mitigate risks of poisoning.

The global Paraquat Aqueous Solution market size was estimated at USD 650.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -3.50% during the forecast period.
