Abstracts

A partial discharge calibrator is a specialized electronic instrument used to generate and inject controlled, known-magnitude partial discharge (PD) signals into high-voltage electrical equipment or PD measurement systems for calibration, verification, and sensitivity testing purposes. It ensures that PD detection and measurement systems, such as those used in transformers, cables, switchgear, and rotating machinery, provide accurate and reliable readings by simulating real-world PD events with precise amplitude, frequency, and waveform characteristics. These calibrators are critical for maintaining the integrity of condition monitoring and diagnostic programs in power utilities, industrial facilities, and electrical testing laboratories, helping to prevent insulation failures and unplanned outages by confirming that PD monitoring equipment functions correctly.

The global Partial Discharge Calibrator market size was estimated at USD 85.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
