Abstracts

Partial discharge testers are specialized diagnostic instruments used to detect, measure, and analyze partial discharge (PD) activity in high-voltage electrical assets such as transformers, cables, switchgear, and rotating machinery. These devices operate by sensing the transient electrical pulses or electromagnetic emissions generated by localized dielectric breakdowns within insulation systems, enabling the assessment of insulation integrity and the prediction of potential failures before catastrophic events occur. They are critical tools for condition-based maintenance, helping utilities, industrial operators, and service providers ensure operational reliability, extend asset lifespan, and comply with safety standards.

The global Partial Discharge Testers market size was estimated at USD 280.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
