Abstracts

A partially enclosed lifeboat is a specialized marine safety vessel designed to provide protection and survival capabilities for occupants during maritime emergencies, combining elements of both open and fully enclosed lifeboats. It features a rigid canopy or shelter that covers a significant portion of the seating area, shielding occupants from harsh weather, sea spray, and direct exposure to elements while allowing some open sections for ventilation and visibility. These lifeboats are typically propelled by oars or a motor, equipped with essential survival gear such as food, water, and first aid supplies, and constructed to be self-righting if capsized. They are required to comply with international safety standards, particularly the International Convention for the Safety of Life at Sea (SOLAS), and are commonly installed on commercial ships, offshore platforms, and large vessels where evacuation safety is critical. The partial enclosure strikes a balance between protection and practicality, offering improved safety over open lifeboats without the full complexity and cost of totally enclosed models.

The global Partially Enclosed Lifeboats market size was estimated at USD 350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
