Abstracts

A particulate matter (PM) analyzer is an instrument designed to measure the concentration and size distribution of airborne particles, often classified by their aerodynamic diameter?such as PM10, PM2.5, and PM1?which are critical indicators of air quality and pollution levels. These devices employ various detection technologies, including light scattering, beta attenuation, tapered element oscillating microbalance (TEOM), and gravimetric methods, to provide real-time or time-integrated data for environmental monitoring, industrial process control, regulatory compliance, and health impact assessments. Their applications span across government agencies, research institutions, industrial facilities, and urban air quality networks, driven by the need to quantify particulate pollution from sources like vehicle emissions, industrial operations, construction activities, and natural events.

The global Particulate Matter Analyzer market size was estimated at USD 245.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
