Abstracts

Particulate Matter (PM) testing refers to the process of measuring and analyzing the concentration of tiny particles suspended in the air. These particles, known as particulate matter, can vary in size and composition and can have various sources, including combustion processes, industrial activities, vehicle emissions, and natural sources like dust and pollen. Particulate matter is categorized based on the size of the particles, usually into PM₁₀ (particles with a diameter of 10 micrometers or smaller) and PM_{2.5} (particles with a diameter of 2.5 micrometers or smaller). There is a growing emphasis on real-time monitoring of particulate matter. Traditional sampling methods, while accurate, may have limitations in providing immediate data. Real-time monitoring allows for more dynamic and responsive management of air quality.

The global Particulate Matter Testing market size was estimated at USD 1823.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.80% during the forecast period.
