## Abstracts

A passive chilled beam is one that is not ducted, does not supply primary air, and does not utilize fan powered equipment for any portion of the air that crosses the coil; they rely on induction air being drawn across the coil by the natural gravitational forces and buoyancy of air. The growth of chilled beams is driven by their energy-efficient and sustainable cooling capabilities, making them a popular choice for commercial, institutional, and industrial buildings. Chilled beams offer a space-saving and environmentally-friendly alternative to traditional HVAC systems, particularly in regions with a focus on energy conservation and green building practices. Here are some factors contributing to the growth of chilled beams:

1. Energy Efficiency: Chilled beams are known for their energy-efficient cooling performance. They use water as a cooling medium, which requires less energy compared to traditional air-based cooling systems that rely on refrigerants and fans.
2. Sustainable Building Practices: The push for sustainable and environmentally-friendly building solutions has led to the increased adoption of chilled beams. They align with green building certifications and contribute to reduced carbon emissions.
3. Indoor Air Quality: Chilled beams provide excellent ventilation and indoor air quality by reducing airborne contaminants and improving thermal comfort.
4. Reduced Ductwork: Chilled beams require less ductwork compared to traditional HVAC systems, allowing for more efficient space utilization and cost savings during installation.

The global Passive Chilled Beams market size was estimated at USD 48.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
