### Report Overview

Passive Daytime Radiative Cooling (PDRC) is an innovative cooling technology that enables surfaces to stay cooler than their surroundings under direct sunlight without consuming energy. This is achieved by designing materials that reflect most of the sunlight while simultaneously emitting infrared radiation through the atmospheric window (8-13 micrometers) into outer space, which effectively radiates heat away. PDRC materials often have a high solar reflectance and high thermal emittance, making them ideal for applications such as building roofs, walls, and outdoor equipment. By passively cooling surfaces, PDRC can reduce the need for air conditioning, lower energy consumption, and mitigate urban heat island effects, contributing to energy efficiency and environmental sustainability.

The global Passive Daytime Radiative Cooling (PDRC) market size was estimated at USD 107 million in 2023 and is projected to reach USD 359.10 million by 2032, exhibiting a CAGR of 14.40% during the forecast period.
