## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Passive Frequency Multiplier competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Passive Frequency Multiplier production reached approximately 596 k units with an average global market price of around US\$1,000 per unit. Single-line annual production capacity averages 65 k unit with a gross margin of approximately 30-40%. The upstream of the Passive Frequency Doubler industry mainly includes high-frequency crystals, capacitors, resistors, and other electronic components, concentrated in the field of electronic components. In terms of downstream applications, communication systems account for approximately 40% of consumption, measurement equipment for 30%, radar systems for 20%, and other applications for 10%. Market demand and opportunity analysis indicates that the growth in the development of high-frequency communication technologies is driving the demand for frequency doublers, along with technological upgrades in the measurement and radar fields, and the urgent need for miniaturized components in compact electronic devices, all of which are jointly propelling the rapid development of the Passive Frequency Doubler market. A Passive Frequency Multiplier is a sophisticated electronic device that harnesses the principles of passive components, such as capacitors, inductors, and resistors, to amplify the frequency of an input signal without the need for active components like transistors or diodes. It operates by manipulating the signal's electrical parameters to achieve a higher frequency output, relying solely on the inherent characteristics of passive elements to accomplish this task. This approach ensures low power consumption, minimal heat generation, and high reliability, making it particularly suitable for applications where energy efficiency and robustness are critical. The multiplier's inherent stability and linear response contribute to the precision of the

frequency multiplication process, allowing for the generation of cleaner and purer frequency outputs.

The global Passive Frequency Multiplier market size was estimated at USD 657.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
