Abstracts

A passive glass break detector is a security device designed to identify the specific acoustic signature associated with glass shattering, whether from windows, glass doors, or display cases, without emitting any signals itself. These detectors utilize highly sensitive microphones and advanced digital signal processing algorithms to filter out ambient noise and distinguish between harmless sounds and the distinct high-frequency (typically 3?5 kHz) vibrations and low-frequency (under 100 Hz) thud produced during breakage. Often used in both residential and commercial security systems, they provide a non-invasive layer of protection by triggering alarms or notifications when a glass break event is confirmed, reducing false alarms from non-threatening sources like slamming doors or clattering dishes.

The global Passive Glass Break Detector market size was estimated at USD 150.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
