Report Overview

Using passive techniques, isolation is attained by limiting the ability of vibrations to be coupled to the item to be isolated.

This is achieved by utilizing a mechanical connection which redirects or dissipates the energy of vibration prior to it getting to the item to be isolated. Passive techniques sometimes entail using electromechanical controls for adjusting the system, but the isolation mechanism itself is passive.

A passive isolation system, such as a shock mount, in general contains mass, spring, and damping elements and moves as a harmonic oscillator. The mass and spring stiffness dictate a natural frequency of the system. Damping causes energy dissipation and has a secondary effect on natural frequency.
