Abstracts

Passive optical devices are non-powered components used in fiber optic communication systems to manipulate light signals without converting them to electrical signals, including devices such as optical splitters (which divide a single optical signal into multiple paths), wavelength division multiplexers (which combine or separate signals of different wavelengths), optical isolators (which prevent back-reflections), optical circulators (which route light sequentially through multiple ports), and attenuators (which reduce signal power), all of which are critical for enabling efficient, reliable, and high-capacity data transmission in telecommunications, data centers, and broadband access networks like Fiber-to-the-Home (FTTH).

The global Passive Optical Device market size was estimated at USD 5580.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
