Abstracts

Passive radiative cooling materials are innovative substances designed to reduce temperatures without the use of energy or active cooling systems. These materials work by reflecting sunlight and radiating heat away from the surface in the form of infrared radiation, which escapes into space. They typically have high solar reflectance and high thermal emittance properties, enabling them to maintain cooler temperatures even under direct sunlight. Applications include cooling buildings, vehicles, and electronic devices, potentially leading to significant energy savings and reduced reliance on air conditioning. These materials contribute to sustainable cooling solutions and help mitigate the urban heat island effect and global warming.

The global Passive Radiative Cooling Materials market size was estimated at USD 120.73 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 14.40% during the forecast period.
