Report Overview:

This report focus on Passive RFID Tags market. Passive RFID systems use tags with no internal power source and instead are powered by the electromagnetic energy transmitted from an RFID reader. Passive RFID tags have no internal power source and wait for a signal from an RFID reader. The reader sends energy to an antenna which converts that energy into an RF wave that is sent into the read zone. Once the tag is read within the read zone, the RFID tag’s internal antenna draws in energy from the RF waves. The energy moves from the tag’s antenna to the IC and powers the chip which generates a signal back to the RF system. This is called backscatter. The backscatter, or change in the electromagnetic or RF wave, is detected by the reader (via the antenna), which interprets the information.

The Global Passive RFID Tags Market Size was estimated at USD 2094.44 million in 2023 and is projected to reach USD 3073.34 million by 2029, exhibiting a CAGR of 6.60% during the forecast period.
