## Abstracts

Passive sensor? is a sensor that does not require external energy and achieves measurement by detecting changes in the physical or chemical properties of the measured object itself. The working principle of passive sensors is based on the capture and conversion of environmental signals. When the sensor material is subject to changes in sensing parameters (such as temperature, pressure, light, etc.), it will produce corresponding changes in physical quantities. These changes in physical quantities are converted into digital or electrical signals for output through changes in the internal and external electric field distribution of the material, changes in charge caused by vibration, etc. Passive sensors have the advantages of simple structure, low cost, high reliability, and easy maintenance, so they have been widely used in many fields.

The global Passive Sensor market size was estimated at USD 37180.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
