Abstracts

Patellofemoral prostheses are specialized orthopedic implants designed to replace the damaged articulating surfaces between the patella (kneecap) and the femoral trochlea (the groove at the end of the thigh bone), typically indicated for patients with isolated patellofemoral osteoarthritis or severe traumatic injury where the rest of the knee joint remains healthy. These devices, often made from medical-grade cobalt-chromium alloys and ultra-high-molecular-weight polyethylene, aim to restore pain-free knee function and mobility while preserving bone stock and native ligaments, offering a less invasive alternative to total knee arthroplasty. Their design varies between inlay and onlay styles, with some systems offering modularity or compatibility with future revision to total knee replacement, reflecting a focus on anatomical reconstruction and long-term patient outcomes.

The global Patellofemoral Prosthesis market size was estimated at USD 123.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.78% during the forecast period.
