Abstracts

Pay-at-Table Solution is a smart payment system integrated into the restaurant industry, designed to optimize the traditional checkout process. This solution digitizes the entire process from ordering to payment through the collaboration of cloud software, mobile terminals, and payment interfaces. Its core functions include: table QR code generation, dynamic order management, online payment integration, and backend data synchronization. This solution significantly reduces labor costs, shortens dining time, and helps merchants collect consumer data to optimize operations. Essentially, it represents a key step in the digital transformation of the restaurant industry, balancing efficiency improvements with user experience. The global development of Pay-at-Table solution exhibits significant regional differences. It is most mature in the Chinese market, having become a standard feature in the catering industry, dominated by platforms such as Alipay, WeChat Pay, and Meituan, with extremely high penetration rates. The North American and European markets are experiencing rapid growth and are deeply integrated with credit card culture, but there is still room for improvement in adoption among independent restaurants. Emerging markets such as Southeast Asia and Latin America are beginning to see adoption alongside the rise of digital wallets, but overall penetration rates are low, mainly concentrated in urban chain brands. Key factors driving global adoption include: mobile payment habits, labor costs in the catering industry, and the maturity of cloud-based SaaS technology. Future growth potential lies in replacing traditional POS systems and the digitalization process in emerging markets.

The global Pay-at-Table Solution market size was estimated at USD 125.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
