The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on PC and PMMA Composite Sheet competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The PC and PMMA composite sheet market refers to the industry surrounding the production, processing, and application of composite materials that combine polycarbonate (PC) and polymethyl methacrylate (PMMA). These sheets integrate the respective strengths of both polymers?PC?s outstanding impact resistance and thermal stability with PMMA?s superior surface hardness, UV resistance, and optical clarity?to create a material that is both durable and aesthetically appealing. The result is a high-performance composite sheet suitable for a wide range of applications in automotive, construction, electronics, and optical industries. PC and PMMA are both thermoplastic polymers, and when co-extruded or laminated, they form a multilayer composite that maintains high transparency while achieving enhanced surface protection and weathering resistance. From a structural perspective, PC/PMMA composite sheets are engineered through advanced extrusion or co-extrusion processes. Typically, the PMMA layer is applied as the top surface to provide excellent scratch resistance, chemical stability, and UV protection, while the PC base layer offers superior mechanical strength, impact resistance, and heat tolerance. This combination ensures that the composite sheet performs reliably under demanding environmental conditions, making it an ideal substitute for glass and other traditional transparent materials. The sheets can be thermoformed, cut, or molded to meet specific design requirements, allowing for great flexibility in industrial applications. The definition of the PC and PMMA composite sheet market encompasses both the material production processes and the associated value chain that includes resin suppliers, sheet manufacturers, fabricators, and end-users across various sectors. Key product forms

include solid sheets, multiwall sheets, corrugated sheets, and coated sheets, all of which can be customized by thickness, color, and surface finish. Common surface treatments include anti-scratch, anti-fog, and anti-UV coatings. The market also includes recycled or eco-friendly variants, reflecting the increasing emphasis on sustainability within the plastics industry. In 2024, global PC and PMMA Composite Sheet production reached approximately 24,825.6 K Sqm, with an average global market price of around US\$ 7743 per K Sqm. The global single-line production capacity ranges from 1000 to 1500 K Sqm per year. The industry's gross profit margin is approximately 25%-40%. The development of the PC and PMMA composite sheet market has been strongly influenced by the evolution of polymer engineering and manufacturing technologies. In the early stages, PC and PMMA were used separately due to differences in their chemical and thermal properties. However, as co-extrusion and adhesive bonding technologies matured, it became possible to produce stable, high-performance composites that integrated the unique attributes of each material. This innovation expanded the market's potential, particularly in high-end applications such as automotive glazing, skylights, noise barriers, safety shields, and digital display panels. Today, continuous technological advancements in co-extrusion equipment, surface modification, and resin formulation continue to improve the optical quality, weather resistance, and mechanical performance of PC/PMMA composite sheets. Looking forward, the future development perspective of the PC and PMMA composite sheet market is closely tied to innovation, regulation, and sustainability. With ongoing improvements in polymer science, it is likely that new grades of PC/PMMA composites will exhibit enhanced resistance to heat, abrasion, and chemicals, broadening their usability in demanding environments. The integration of nanotechnology and surface coating advancements may further improve their optical performance, enabling applications in solar panels, optical lenses, and high-definition display systems. Furthermore, digital manufacturing techniques such as 3D printing and precision thermoforming are expected to create new opportunities for custom-shaped PC/PMMA components. As additive manufacturing evolves, the compatibility of composite sheets with these emerging processes will determine their competitiveness in high-value markets. Additionally, the push toward electric vehicles, smart infrastructure, and energy-efficient buildings will ensure long-term demand for transparent, strong, and lightweight composite materials. The PC and PMMA composite sheet market represents a rapidly evolving sector that merges the benefits of two advanced thermoplastics into one multifunctional material. Its definition encompasses not only the physical combination of PC and PMMA but also the broader industrial ecosystem that supports its production, customization, and application across multiple sectors. As technological innovation and environmental awareness continue to reshape material selection criteria globally, PC/PMMA composite sheets are poised to play an increasingly important role

in next-generation manufacturing, construction, and design solutions. Their versatility, performance, and sustainability potential make them a cornerstone of the modern materials landscape. The global PC and PMMA composite sheet industry has a high concentration. Global key players of PC and PMMA composite sheet include Sichuan Longhua Film, and Teijin, etc. The top two players hold a share about 50%.

The global PC and PMMA Composite Sheet market size was estimated at USD 192.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 25.70% during the forecast period.
