Report Overview

The liquid cooling systems in a computer are a lot like the internal combustion engines found in most vehicles. A water-block is first set up on the CPU and through this the cooling water runs through the CPU before making its way to a radiator. Often, the radiator itself needs cooling of its own and is kept cool by a fan or a Peltier cooler. Liquid cooling is fairly complex method and is rarely used in computers despite its efficiency. The real danger that comes with liquid cooling is that in case of a coolant leak, the water can seep through to all the critical parts of the computer and can irreversibly damage your CPU.
