## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on PCB Circuit Ink competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. PCB circuit ink is generally divided into three types, namely PCB circuit etching ink, solder mask ink, and marking ink. There are also some conductive carbon oil (also known as conductive carbon ink) and conductive silver oil (also known as conductive silver paste), and the latter two are generally used in relatively small quantities. The substrate of PCB board is copper-clad laminate, with a layer of copper foil on top. It needs to be screen printed with photosensitive etching ink, and then cured by exposure and development to etch away the unexposed areas before ink removal. This type of circuit etching ink is mainly used for protection. After etching the circuit, sodium hydroxide solution will be used to remove the ink later. PCB circuit board solder mask ink, also known as solder mask ink. Solder mask ink is a very common and mainly used ink in PCB circuit boards. The layer of green paint on the circuit board we see is actually solder mask ink.

The global PCB Circuit Ink market size was estimated at USD 2863.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
