Abstracts

PCB circulation water chiller is a kind of equipment specially designed to provide stable cooling water in the manufacturing process of printed circuit boards, ensuring the smooth progress of high-temperature processes such as drilling, cutting, etching and welding. It continuously supplies cooling water at a set temperature through a circulation system to prevent material deformation or equipment damage caused by overheating, thereby improving production efficiency and product quality. The core components include high-efficiency compressors, precision temperature control systems, heat exchangers and circulating water pumps. The compressor refrigerant circulates, absorbs heat from the cooling water and discharges it; the heat exchanger realizes efficient heat transfer between cooling water and refrigerant; and the circulating water pump ensures that the cooling water flows evenly throughout the entire production process. The advanced temperature control system can automatically adjust the temperature according to real-time needs, ensuring a constant cooling effect while reducing energy consumption.

The global PCB Circulation Chillers market size was estimated at USD 756.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
