## Abstracts

The PCB cooling buffer machine is used for SMT or coating production lines and has two main functions. 1. Relieve the production speed issue of front-end and back-end devices. If the front-end devices are too fast or the back-end devices have abnormalities, resulting in product PCBA or PCB accumulation, the temporary storage machine can automatically store the products produced by the front-end devices, balance the speed of the front-end and back-end machines, and play a buffering role in the production speed of the front-end and back-end devices. 2. Temporary storage function: In the dispensing/coating production line, after dispensing or applying glue to PCBA, set the buffer time of the temporary storage machine and implement a first in first out mode for PCBA. The product is naturally dried (cured) through the temporary storage machine

The global PCB Cooling Buffer market size was estimated at USD 102.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
