Abstracts

PCD (Polycrystalline Diamond) Drills and CVD (Chemical Vapor Deposition) Diamond Drills are advanced cutting tools used for high-precision drilling in hard, abrasive, and non-ferrous materials. These tools are commonly used in industries that require high cutting performance, long tool life, and precision, such as automotive, aerospace, and electronics manufacturing. PCD Drills: Made from synthetic diamond crystals bonded together to form a polycrystalline structure, PCD drills are known for their exceptional hardness, wear resistance, and high thermal conductivity. These drills are most commonly used for drilling non-ferrous materials, such as aluminum, copper, brass, and composites. CVD Diamond Drills: CVD diamond drills are coated with a thin layer of diamond material, which is deposited onto a substrate (often tungsten carbide) through chemical vapor deposition. This coating enhances the hardness, wear resistance, and performance of the drill, especially in demanding applications like machining hardened steels, ceramics, and high-temperature alloys.

The global PCD and CVD Drills market size was estimated at USD 2361.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
